Why let your NFTs sit idle?

NFrent

Story

1—

The Problem

Do you own NFTs?

Market of inactive NFT Holders

Satiated by the utilities that the NFT provides

Want to jump into newer exciting NFTs while not losing

ownership of the current ones

- stoner cats
- BAYC
- don't want to actively manage NFT positions

**Market of admirers of the same NFTs,
communities
or to use the positions to gain the fees**

2—

The TBTs

Time Bound Tokens

a token that makes it possible to transfer and manage ownership of the timeline of an asset

Time bounded assets like

- for subscription based services => avail specific services during the subscription period
- time-limited voting/gov => can enable special abilities during a specific time interval
- time dependent access/rewards => can be used for contributors based on engagement in the community of a protocol which enables them with elite powers
- renting RWAs
- escrow positions => acting as intermediaries, secure assets until predefined conditions are met

Time Bound Tokens

Designed as a utility token

The owner of the TBT has the right to utilize the underlying asset for some economic benefit via calling the utility function

Ownership of the token is determined by checking if present time is part of the claim of the timeline by the user.

Example of these benefits could be the following:

- Minting new Crypto Kitty eggs with the wrapped Crypto Kitty.
- Collecting fees with the wrapped Uniswap liquidity position.
- Calling a governance related function.
- Swapping between USDC and ETH following a constant sum formula (options).
- Representing renting of real estates.
- Recurring Payments
